AutoCAD is used for 2D drafting and 2D and 3D architectural design, and is often used in place of a traditional drafting board. The app is open-source, meaning that the code is free for non-commercial use. The free version of AutoCAD can be used for personal projects; with its latest iteration it can be used for certain 3D work, such as creating custom user-defined constraints. This model is usually referred to as a "freemium" model. AutoCAD is a powerful and frequently used software tool. It reads some data from the phone memory (contents of a text file) and displays it on screen. It is a single activity app. App B is a more complicated one. It will be an app in itself. It will also read from the phone memory and display the data to the user. My question is how do I access App B's data in App A? I'd like to be able to show some text on the screen based on data from App B. App A is an app that does not have any server side programming. App B is an app that I would like to be server-less as well. In App B, I am using the contents of the phone memory as a way of storing data in a database. I have some experience with inter-process communication and I tried that approach, but it does not seem to be what I need. I am not doing anything as fancy as using the web server in App B to allow the user to access and save data in a database in App A. It seems like this would not be the best approach anyway. Thanks A: Simply use Content Providers. Basically, App A uses Content Provider and App B uses Content Resolver. The idea is to share data between them without touching each other's methods. Professional-level marking tools in AutoCAD. Use the built-in Markup Assistant to annotate or mark anything you see on paper or screen. Change existing annotations with one or more clicks, mark in multiple colors, apply gradients, or erase markings. (video: 2:34 min.) Graphical Notebook: The best way to keep track of all your notes is in the Graphical Notebook. Keep notes about any drawing file, and they appear in the notebook window where you need them. Import notes from drawings you created in other applications, and review them alongside your AutoCAD drawings. (video: 2:09 min.) AutoLISP: The most widely adopted programming language in the world. With AutoLISP, you can learn how to develop custom solutions in the AutoCAD environment and create your own programs for your CAD applications. (video: 2:09 min.) The Schema Cloud: Staying up to date on the latest CAD standards is a constant challenge. With the Schema Cloud, Autodesk can help you discover the latest CAD standards in a single central location. The Schema Cloud aggregates schemas from third-party CAD software providers. You can browse by the latest version, download the most current schema for your application, and display detailed descriptions. (video: 3:30 min.) Mesh-based solid modeling: Combine multiple meshes to create more complex objects, such as buildings. Using a mesh on a building enables you to edit parts independently, such as floors or windows. If you create a complex part such as a window, you can later edit the individual windows. (video: 3:36 min.) Mesh inspection: Mesh inspection is a technology that allows you to see and fix geometry that is hidden in your drawings. Unlike a hidden feature, a mesh inspection has a visual representation. Edit geometry, such as doors and windows, in real-time without the need to hide and unhide geometry. (video: 2:29 min.) Collision detection with SolidWorks: You can use the built-in collision detection in SolidWorks to detect the collision and movement of any objects in your drawings. This technology can help you analyze and optimize CAD drawings before creating them. (video: 2:21 min.) Dual View: Visualize and compare your designs in multiple views. When you design in multiple views simultaneously, it
